

Music Library Management Application with Playlists

Description:

This project is a console application written in C language that manages a music library.

It handles a list of tracks with their details (title, artist, duration, genre, year, number of plays), as well as multiple playlists.

Implemented without using structs, and with dynamic memory management using malloc, realloc, and free.

Main Features:

- Add, modify, and delete tracks.
- Search tracks by title, artist, or genre.
- Sort tracks by popularity or by release year.
- Create, display, and modify multiple playlists.
- Add, remove, and reorder tracks in playlists.
- Automatically generate a playlist by genre.
- Simulate playback (normal or random mode).
- Recommend similar tracks by genre.

Technologies:

- Language: C (ISO C99 compatible)
- Dynamic memory: malloc, realloc, free

Usage:

1. Clone or download this repository.
2. Compile: `gcc -o music_library music_library.c`
3. Run: `./music_library`
4. Use the menu to manage music and playlists.
